ABSTRACT

Novel proteins have been designated "cerberus" and "frzb-1," respectively. Cerebus is expressed as a secreted peptide during embryogenesis of the Xenopus embryo, and is expressed specifically in the head This new molecule has endodermal, organizer region. cardiac, and neural tissue inducing activity, that should prove useful in therapeutic, diagnostic, and requiring regeneration, clinical applications differentiation, or repair of these and other tissues. Frzb-1 is a soluble antagonist of growth factors of the Wnt family that acts by binding to Wnt growth factors in the extracellular space. A third novel protein is therm PAPC which promotes the formation of dorsal mesoderm and somites in the embryo.
